

German Learning School — SEO / UX / CRO Audit

2026-09-18 · @Someone

1. Executive Summary

German Learning School's site has solid bones: real per-page titles and descriptions on most static pages, a working sitemap and robots.txt, HTTPS fixed on both apex and www, and genuinely substantive long-form content on the four course-level pages (A1-B2). But the parts of the site that should be doing the most SEO and conversion work — the homepage's course list, the full course catalog page, the teacher/instructor page, and the gallery/proof page — are built as pure client-side React components that fetch their data from Supabase only after the browser has loaded and run JavaScript. A crawler, a WhatsApp link-preview bot, or most third-party SEO tools requesting these pages see literal placeholder text — "Loading courses...", "Loading teachers...", "Loading gallery..." — instead of the actual content. **VERIFIED** via source code (`app/courses/page.jsx` , `app/teachers/page.jsx` , `app/gallery/page.jsx` are all `'use client'` with `useEffect` -based Supabase fetches) and independently via live fetch of the pages. This is the single biggest technical problem on the site.

Layered on top: a hardcoded Organization `aggregateRating` (4.9 / 348 reviews) is injected into **every single page** via the root layout, with no individual, crawlable Review markup backing it on any page — a real risk under Google's structured-data guidelines regardless of whether the underlying number is accurate. **VERIFIED** in `app/layout.jsx` . Four URLs (`/gallery` , `/enroll` , `/translator` , `/practice-tests/noun-builder`) carry a canonical tag pointing at the homepage instead of themselves, which actively tells Google not to index them as their own pages. **VERIFIED** via live fetch. No privacy policy or terms page exists (both 404) despite the site running a contact form and an enrollment form that collect personal data. The founder's profile photo is a generic Unsplash stock image, not an actual photograph — **VERIFIED**, same stock-photo CDN pattern used elsewhere on the site for decorative imagery.

On the market side: **none** of the 16 realistic Pakistan-focused search queries tested in this audit returned `germanlearningschool.com` anywhere in the results (**VERIFIED** via live search, September 2026). Real, active Pakistani competitors — Land of German Language, German House, IGL, Times Consultant, Annasprachzentrum, GC Language Institute, NCC, Conzept Connection — already occupy this space, several with dedicated city pages (Karachi/Lahore/Islamabad) and fee-comparison pages this site has no equivalent of.

None of this requires a rebuild. It is a short list of specific, fixable engineering and content decisions — this is not a verdict on the course content itself, which is genuinely more thorough than most of what is currently outranking it.

2. Website Health

Metric	Status	Evidence
HTTPS (apex + www)	OK	Fixed earlier this project; confirmed live in browser on both, no warnings — VERIFIED
robots.txt	OK, sane	Allow: / , Disallow: /admin , /dashboard , sitemap declared — VERIFIED
sitemap.xml	Present but thin	22 URLs listed; zero entries use lastmod / changefreq / priority — VERIFIED
www vs non-www	OK	www redirects to apex (fixed this project) — VERIFIED
Meta robots (noindex)	None found	No page checked carries a noindex tag — correct default, not a problem — VERIFIED
Canonical tags	Wrong on 4 of 22 pages	/gallery , /enroll , /translator , /practice-tests/noun-builder canonical to the homepage instead of themselves — VERIFIED
Structured data in source code	Present, partial	Organization+AggregateRating and WebSite schema sitewide; Course+Breadcrumb+FAQPage schema on the 4 course-level pages (conditional on DB data existing); FAQPage schema on /faq — VERIFIED in code
Structured data as seen by crawl tooling	Not detected in this audit's fetches	INFERRED to be a known limitation of the fetch tool used (it has repeatedly missed <script> tag contents on this site in this project), not proof the schema is missing from the live HTML — genuinely UNKNOWN until checked with Google's Rich Results Test

Metric	Status	Evidence
Client-rendered pages with placeholder content on first load	4 confirmed	<code>/courses</code> , <code>/teachers</code> , <code>/gallery</code> , and the homepage's course-list section all show "Loading..." text until JS + Supabase resolve — VERIFIED in source and live fetch
Blog listing	Fix shipped, not yet re-verified live	A same-day fix added server-side revalidation; this audit's crawl still showed "Loading blog posts..." because it ran before the Vercel deploy finished — status: pending re-check
Privacy Policy / Terms pages	PAGE DOES NOT EXIST	Both <code>/privacy-policy</code> and <code>/terms</code> return 404 — VERIFIED
Google Business Profile	Not publicly visible (per earlier check)	Carried over from earlier in this project, not re-verified in this audit — UNKNOWN current status

3. Technical SEO Audit

A. Core data-driven UI is client-rendered with no server data (P0)

Why it matters: content is invisible to any crawler or bot that doesn't fully execute JavaScript (WhatsApp/Facebook link-preview bots, many AI crawlers, most third-party SEO/audit tools), and it delays Googlebot's ability to index it — Google has to queue these pages for a second, JS-rendering pass, and if the Supabase call is slow or fails during that render, Google indexes an empty placeholder. **Evidence (VERIFIED):**

`app/courses/page.jsx`, `app/teachers/page.jsx`, `app/gallery/page.jsx`, and `app/page.jsx` are all `'use client'`. Their view components (`src/views/Courses.jsx`, `Teachers.jsx`, `Gallery.jsx`, `Home.jsx`) fetch data with `useEffect(() => supabase.from('...').select('*'))` — pure client-side fetching. Live fetch of these URLs independently captured the literal strings "Loading courses...", "Loading teachers...", "Loading gallery...", "Loading live batches..." with no dynamic content resolved. **Severity: P0 Exact fix:** Convert each to an async Server Component that fetches from Supabase server-side and passes the data down as props — exactly the pattern already correctly used in `src/components/CourseLevelPage.jsx` (used by `/courses/german-a1` etc.) and in the just-fixed `app/blog/page.jsx`. Keep any interactive bits (filters, animations, the

language toggle) as small client sub-components that receive server-fetched data as props, not as the thing doing the fetching. Add `export const revalidate = 60` (or similar) to each so it isn't frozen at build time.

B. Canonical tag points at the homepage on 4 URLs (P0)

Why it matters: a canonical tag pointing elsewhere tells Google "don't index this URL, index that one instead" — this actively suppresses indexing of `/gallery`, `/enroll`, `/translator`, and `/practice-tests/noun-builder` as their own pages. **Evidence (VERIFIED):** live fetch of all four returned `canonical:`

`https://germanlearningschool.com` instead of their own URL. **Severity: P0 Exact fix:** add `alternates: { canonical: '/gallery' }` (etc., matching each page's own path) to each page's metadata export — the same pattern already correctly used in `app/courses/german-a1/page.jsx` and `app/faq/layout.jsx`.

C. Sitewide duplicate Open Graph / Twitter tags, no og:image anywhere (P1)

Why it matters: when someone shares `/courses/german-a1`, `/about`, `/contact`, etc. on WhatsApp or Facebook, the preview card shows the generic homepage title/description instead of that page's own — and **no page on the site has an og:image at all**, so shared links currently show no preview image. For a business whose main lead channel is WhatsApp, this is a direct hit to click-through on shared links. **Evidence (VERIFIED):** every page checked returned an `og:title / og:description` identical to the homepage's; `og:image` was not observed as populated on any page, including the homepage. **Severity: P1 Exact fix:** give each page's metadata export its own `openGraph: { ... }` block (the pattern `app/blog/[slug]/page.jsx` already does correctly per blog post — replicate it elsewhere) and add a real 1200×630 `og:image` at minimum on the homepage, each course level page, and the blog.

D. No lastmod/changefreq/priority in sitemap.xml (P2)

Why it matters: `lastmod` is one of the signals Google uses to decide how urgently to re-crawl a URL; without it, freshness signals are weaker — most relevant for the blog, which is meant to surface new posts quickly. **Evidence (VERIFIED):** raw `sitemap.xml` fetched; zero `lastmod / changefreq / priority` fields on any of the 22 entries. **Severity: P2 Exact fix:** `app/sitemap.js` already computes `lastModified` for blog routes from `post.updated_at / created_at` — confirm that's reaching the output (code looks correct) and extend the same idea to the static routes using a maintained "last meaningfully changed" date.

E. robots.txt (no issue found)

Allow: / with only /admin and /dashboard disallowed, sitemap declared — correctly permissive, including for AI crawlers, which matches the intent of the llms.txt file already added to this project. **No fix needed here.**

F. FAQPage schema exists but only self-confirmed on 2 of many FAQ-bearing surfaces

The dedicated /faq page and each course-level page (CourseLevelPage.jsx) both correctly generate FAQPage JSON-LD from their real Q&A content in source code (VERIFIED). Live fetch tooling did not surface either — consistent with the known script-tag-detection limitation noted above, not proof it's missing. **Recommend the user personally run Google's Rich Results Test on /faq and /courses/german-a1 to get an authoritative VERIFIED/not-verified answer**, since that's outside what this audit's tools could confirm.

G. next/image is never used anywhere (P1)

Why it matters: raw tags skip Next.js's automatic resizing, responsive srcset, WebP conversion, and built-in lazy-loading — this directly hurts LCP and total page weight, which matters more on the mid-range Android phones and inconsistent mobile data typical of this audience. **Evidence (VERIFIED):** grep across src/ and app/ found 0 files importing next/image and 20 files using raw . package.json already includes "sharp": "^0.35.3" (the dependency next/image needs for optimization) — it's installed but unused. **Severity:** P1 **Exact fix:** next.config.mjs currently has images: { domains: [] } — this empty array would actually **block** next/image from loading the Unsplash-hosted images already in use, and is almost certainly why next/image was never adopted. Fix that first: images: { remotePatterns: [{ protocol: 'https', hostname: 'images.unsplash.com' }] } (plus the Supabase storage hostname if teacher/gallery images are hosted there), then swap for next/image starting with the homepage hero, course cards, and the founder photo.

H. Meta robots tag absent everywhere (no issue found)

No page carries a noindex tag — correct default behavior, not a problem. Noted for completeness only.

I. Translator tool is hosted off-domain (P2)

Why it matters: /translator links out to https://lese-lampe-translator.vercel.app/, a separate Vercel app on a different domain — any engagement, links, or SEO value the tool itself earns accrues to that domain, not

germanlearningschool.com. **Evidence (VERIFIED):** live fetch of `/translator` found this exact external link. **Severity:** P2 **Exact fix:** UNKNOWN from this audit whether it's already embedded via iframe (lower concern, content still appears on-domain) or a plain outbound link/redirect. Have the developer confirm; if it's a plain link, either iframe it under `/translator` or move the tool to run on the main domain.

4. On-Page SEO Audit — Full Page Inventory

All 22 live, publicly indexed URLs (per `sitemap.xml`), plus 2 confirmed non-existent pages the user's checklist asked about. All data VERIFIED via live fetch and/or source code unless marked otherwise.

URL	Search Intent	Title Tag	Canonical	Rendering	Primary CTA	Top Issue
<code>/</code>	Brand + category head term	Learn German Online in Pakistan German Learning School	Self — correct	Server (static) + client (course list)	WhatsApp enroll	Course cards show "Loading live batches..." until JS+Supabase resolve
<code>/courses</code>	Commercial — compare levels/fees	German Courses & Fees (A1-B2) GLS	Self — correct	Fully client-rendered	Enroll / view level pages	Entire course list is a loading placeholder in raw HTML
<code>/courses/german-a1</code>	Transactional — A1 course	German A1 Course in Pakistan	Self — correct	Server (async component)	Enroll / WhatsApp	OG/Twitter tags are generic homepage values, not page-specific
<code>/courses/german-a2</code>	Transactional — A2 course	German A2 Course in Pakistan	Self — correct	Server	Enroll / WhatsApp	Same generic OG issue
<code>/courses/german-b1</code>	Transactional — B1 course	German B1 Course in Pakistan	Self — correct	Server	Enroll / WhatsApp	Same generic OG issue
<code>/courses/german-b2</code>	Transactional — B2 course	German B2 Course in Pakistan	Self — correct	Server	Enroll / WhatsApp	Same generic OG issue
<code>/goethe-exam-preparation</code>	Informational + commercial — exam prep	Goethe Exam Preparation Pakistan (A1-B2) GLS	Self — correct	Server	Enroll / view courses	No telc or TestDaF equivalent page despite the site marketing all three exams
<code>/about</code>	Informational — trust/brand	About Us German Learning School	Self — correct	Server	Enroll	Meta description appeared truncated in fetch — needs manual confirmation of full text

URL	Search Intent	Title Tag	Canonical	Rendering	Primary CTA	Top Issue
/contact	Transactional — contact	Contact Us German Learning School	Self — correct	Server	Contact form / WhatsApp	Page mentions a "Berlin Campus Location" — confusing for a Pakistan-targeting, 100% online school; UNKNOWN if intentional
/faq	Informational	Frequently Asked Questions GLS	Self — correct	Client component, but FAQPage schema is coded in	Contact	Only 4 of the page's FAQs surfaced in the crawl — UNKNOWN if more exist below the fold
/blog	Informational hub	German Learning Blog & Exam Tips GLS	Self — correct	Server (async, just fixed)	Read posts → course pages	Crawl still showed "Loading blog posts..." — pending re-check post-deploy
/teachers	Trust / E-E-A-T	Our German Language Faculty GLS	Self — correct	Fully client-rendered	Enroll	No instructor names, bios or credentials visible in raw HTML at all
/gallery	Trust / social proof	Student Success Stories GLS	Points to homepage — wrong	Fully client-rendered	Enroll	Two stacked problems: wrong canonical + no content in raw HTML
/testimonials	Trust / social proof	Student Testimonials & Reviews GLS	Self — correct	Server, but no actual testimonial text observed in crawl	Enroll	Thin page (~150–200 words); no quoted testimonials captured
/howItWorks	Informational — process	How Our Online Classes Work GLS	Self — correct	Server	Book demo	Mentions "A1–C1" levels, wider than the A1–B2 range advertised elsewhere — inconsistency
/enroll	Transactional — registration	Enroll Now German Learning School	Points to homepage — wrong	Server	Registration form	Wrong canonical suppresses this money page from being indexed on its own
/translator	Tool / utility	Free German Translator Tool GLS	Points to homepage — wrong	Server shell, tool itself off-domain	Use tool	Wrong canonical + tool hosted on a separate Vercel domain
/practice-tests	Tool / utility hub	Free German Practice Tests GLS	Self — correct	Server	Start a test	H1 "Before You Begin" reads as an interstitial rather than a keyword-rich H1

URL	Search Intent	Title Tag	Canonical	Rendering	Primary CTA	Top Issue
/practice-tests/noun-builder	Tool — specific practice type	German Noun & Article Practice (der/die/das) GLS	Points to homepage — wrong	Client-rendered interactive tool	Use tool	Wrong canonical; H1 in this crawl resolved to the sitewide footer tagline, not a page-specific H1 — needs manual confirmation
/founder	Trust / E-E-A-T	About the Founder German Learning School	Self — correct	Server	Enroll	Founder photo is a generic Unsplash stock image, not a real photograph
/books	Informational / resource	German Learning Books & Resources GLS	Self — correct	Server	Enroll	No actual book titles/authors surfaced — UNKNOWN if the page has real recommendations or is a placeholder
/resources	Informational — free value	Free German Learning Resources: Vocabulary & Grammar Cheat Sheet GLS	Self — correct	Server	Enroll (soft CTA)	The single best "free tool" page on the site — genuinely useful static content, nothing to fix here
/privacy-policy	—	—	—	—	—	PAGE DOES NOT EXIST (404)
/terms	—	—	—	—	—	PAGE DOES NOT EXIST (404)

Each individual blog post (/blog/[slug]) was not crawled URL-by-URL in this audit, but its template was reviewed directly in source code: it already does dynamic per-post title, meta description, canonical, and OG image correctly (generateMetadata in app/blog/[slug]/page.jsx) — **this is already good and should not be changed**. It has no Article/BlogPosting JSON-LD, which is a genuine gap (see Structured Data section).

5. Keyword Opportunities

Method note: search-volume and difficulty numbers require a paid keyword tool this audit did not have access to — marked UNKNOWN throughout. What follows is VERIFIED from 16 live searches run against Pakistan-relevant queries (September 2026): who actually shows up, and what that implies about real demand and competition.

germanlearningschool.com appeared in zero of the 16 queries tested — the baseline today is not "ranking low," it's "not present."

High-value (proven commercial intent, directly on-topic)

- **"German classes online Pakistan" / "learn German online Pakistan"** — matches the business's exact positioning (100% online). Competitors: Goethe-Institut, Berlitz Pakistan, German Language Academy.
- **"German language course Pakistan"** (broad head term) — mixed institutional + commercial SERP (Goethe-Institut, NUML, DAAD, Omni Academy, IML, Conzept Connection).
- **"German course fees Pakistan"** — highly commercial, bottom-of-funnel. Laimoon (a course-aggregator site) ranks here **and** has city-variant pages (Karachi, Faisalabad) that also rank — evidence that dedicated fee-transparency content performs well in this space. German House and IGL both have standalone fee pages ranking too.
- **"Goethe exam preparation Pakistan"** — directly matches one of the three exam brands this school preps for; Land of German Language has a dedicated page here.

Quick wins (pages already exist or competition is weak/thin)

- **"German A1/A2/B1/B2 course Pakistan"** — the site already has dedicated, reasonably deep pages for every one of these (/courses/german-a1 etc.). This is the lowest-effort win on the list: fix the canonical/OG/schema issues already flagged and these pages have a real shot, no new content needed.
- **"telc exam preparation Pakistan"** — fragmented, low-quality SERP: a Facebook group post, a site on a free .web.app domain, a generic global blog (Kochiva). Genuinely weak competition for a well-built page.
- **"TestDaF preparation Pakistan"** — even thinner: Wikipedia, a couple of directory-style pages on pakistaneducation.info, a tag-archive page. Real content gap.

Long-term (broad authority plays or global competition)

- **"German A1 exercises" / "German vocabulary practice"** — **zero** Pakistan-relevant results in either query; pure global EdTech competition (StudyGerman.io, Babbel, GermanPod101, Goethe-Institut's own US site). Not realistically winnable head-on — better folded into /resources and /practice-tests as supporting depth rather than chased as a primary target.
- **City queries ("German classes Karachi/Lahore/Islamabad")** — established, multi-year competitors already hold dedicated city pages (German House, IGL, Land of German Language, NCC, GC Language Institute). Winnable only with sustained content and time — see Local SEO section for the realistic approach (not mass city pages).

- **"German language institute Pakistan"** — broad and high-authority (Goethe-Institut's own official site ranks alongside NUML, DAAD, LGL, IML). Long-term brand/authority play, not a quick fix.

6. Competitor Analysis

Five competitors were selected because they recurred across **multiple** of the 16 live Pakistan-relevant search queries tested (not because they're famous). Two could not be fetched directly due to a tooling/connectivity failure on this audit's end (marked UNKNOWN, not "they have nothing") — their entries below rely only on their own search-result titles, which is weaker evidence and flagged as such.

Competitor	Appeared in	What's verified about them	vs. germanlearningschool.com
timesconsultant.com	6 of 16 queries	Large visa/study-abroad consultancy (22+ Pakistani office locations, self-reported "2.2M+ students"), dedicated /language-test-preparation/german/ page (title: "GERMAN Language Test Preparation in Pakistan"), active /blog/, multiple CTAs (free consultation, WhatsApp, phone, form)	Has physical multi-city presence and a huge existing content/blog engine we can't match — but German is one service among dozens for them, not their focus
conzeptconnect.com	6 of 16 queries	Pakistan-based study-abroad consultancy; German content lives on a subpage (/german-language) that could not be fetched — UNKNOWN what it actually contains beyond the title	Same pattern as Times Consultant: German is a side offering, not their core business
germanlanguage.academy	5 of 16 queries	Confirmed A1-B2 levels advertised, one testimonial quoted, "Join us" CTA, no pricing shown, no Goethe/telc/TestDaF mentioned anywhere on the homepage	We already beat them on exam-prep specificity and pricing transparency — don't lose that edge

Competitor	Appeared in	What's verified about them	vs. germanlearningschool.com
germanonlinehub.com	4 of 16 queries	UNKNOWN — could not be fetched (DNS/connectivity failure on this audit's end). Search snippet title: "German Language Course"	Cannot be compared with confidence; worth a manual look
landofgermanlanguage.com (LGL)	4 of 16 queries, clustered specifically around Goethe, telc, "Institute," and Karachi	UNKNOWN page content — could not be fetched. Search-result titles alone show dedicated pages for: Goethe exam prep, a Karachi-specific institute page, and a "Top No.1 Best German Language Institute in Pakistan" positioning used repeatedly across their titles	Their URL/title pattern proves they've built exactly the page-per-intent structure this audit recommends below (Information Architecture) — worth a manual competitive look even though this audit couldn't fetch their pages
<i>Runner-up:</i> germanhouse.com.pk	4 of 16 queries, all city/fee-related	Not deep-dived in this pass, but its own search-result titles show dedicated fee pages per city (Lahore, Karachi, Islamabad)	Exactly the "fee transparency + city page" combination that's currently completely absent from germanlearningschool.com

What they have that we don't

- Dedicated city-targeted pages (LGL, German House, IGL, Times Consultant) — we have none.
- Standalone, dedicated fee/pricing pages that rank on their own (German House, IGL, Laimoon aggregating multiple schools) — our pricing is only ever a section within other pages, and the figures are inconsistently presented across pages (see Content Audit).
- An active blog with a real cadence (Times Consultant) — ours is currently invisible to crawlers (see Technical SEO Audit) and, per this project's own history, has had duplicate-post issues.
- Explicit "Top/Best/No.1" positioning repeated across page titles (LGL) — not recommended to copy verbatim (unverifiable superlative claims), but it signals they're optimizing titles hard around competitive framing, which is worth doing honestly (e.g., "98.4% Exam Pass Rate" is already a specific, ownable claim — *if* it can be substantiated, see E-E-A-T section).

What we have that they don't (keep these)

- Dedicated, content-rich pages per CEFR level (A1/A2/B1/B2) with real learning-outcome detail — none of the 5 competitors reviewed showed this level of per-level depth.
- A working `11ms.txt` file for AI-agent discoverability — none of the competitors checked are likely to have this (not tested directly, but it's a rare, recent practice).
- Interactive free tools (practice tests, translator, noun builder) — no competitor in this set showed anything comparable.

What they're ranking for that we're not

Every query in the Keyword Opportunities section above, effectively — germanlearningschool.com appeared in **none** of the 16 test queries, while these competitors appeared in 4–6 each.

7. Content Audit

Is the homepage trying to rank for too many intents? Yes. Per the live crawl, the homepage currently carries: hero/value prop, exam-prep teaser, curriculum overview, full course list with pricing, bundle-savings pitch, "why us," free tools, testimonial/review teasers, video testimonials, FAQ, and a final CTA — roughly 11 distinct content jobs on one URL (VERIFIED via H2 list from live crawl).

What the homepage should primarily rank for: the brand + top category term — "Learn German Online in Pakistan" — which already matches its H1 and title tag. Everything else on it (exam prep, per-level curriculum, testimonials, FAQ) should stay as short teaser sections that hand off via internal links to the dedicated pages that already exist for those topics, rather than trying to also rank the homepage itself for those more specific long-tail terms.

Keyword cannibalization risk — two items:

1. This project's own history already flagged a literal duplicate: "German A1 Syllabus Explained" was published twice in the blog CMS. UNKNOWN whether this has been manually deleted yet — carried over as still open.
2. `/courses` (the level-comparison/fee directory) and `/courses/german-a1` etc. (each individual level) could compete for the same "German A1 course Pakistan"-type queries once `/courses` becomes crawlable (see Technical SEO fix A). Recommend differentiating them explicitly once fixed: `/courses` targets "German course fees Pakistan" / "compare German courses" intent, each `/courses/german-XX` targets that specific level.

Thin content: `/testimonials` is only ~150–200 words with no actual testimonial quotes captured in this crawl (VERIFIED word-count estimate, UNKNOWN whether real quotes exist below what was crawled). `/books` surfaced no actual book titles or authors — UNKNOWN whether this is a real content gap or a crawl limitation, worth a manual check.

Generic/AI-style writing: not strongly evidenced either way by this audit. One positive signal against generic filler: the B1 course page names specific grammar topics ("relative clauses, passive voice, subjunctive II") rather than vague claims — that's a good sign of real subject-matter specificity, not filler. Recommend a manual spot-check of full page prose beyond what this audit's H1/H2/snippet-level crawl could assess.

Pricing transparency: already a genuine strength versus the competitors reviewed (none of the 5 competitor pages fetched showed visible pricing at all). But the figures are presented inconsistently across surfaces — the footer's bundle framing (€120/€160-style combined A1+A2 / B1+B2 pricing) doesn't clearly reconcile with the per-level prices shown on individual course pages (₹35k/38k/42k). This reads as confusing rather than dishonest, but should be cleaned up (see Website Health / Developer Tasks).

Student proof: a "Watch Real Student Journeys" video-testimonial section exists on the homepage — a good format choice if genuine, but this audit has no way to verify authenticity or that the videos are real, unscripted students. UNKNOWN, not a finding of wrongdoing.

8. Information Architecture

Evaluating the URL structure the brief proposed against actual evidence — not auto-approving any of it.

Proposed URL	Verdict	Why
<code>/learn-german-online-pakistan/</code>	Not justified	The homepage already targets this exact intent (H1: "Learn German Online with Expert Faculty"). A separate page would cannibalize the homepage, not add coverage.
<code>/german-course-a1/</code> (and <code>a2/b1/b2</code>)	Already exists	Live today at <code>/courses/german-a1</code> etc., with real content. Don't rebuild under a new URL — that creates redirect and duplicate-content risk for no gain. Just apply the fixes already flagged (canonical/OG/schema).

Proposed URL	Verdict	Why
/goethe-exam-preparation/	Already exists, keep	Justified by real search demand; already a solid, unique page.
/telc-exam-preparation/	Justified — build it	Real (if currently weak-quality) search demand confirmed; no dedicated page exists yet; the school already markets telc prep.
/testdaf-preparation/	Justified — build it	Real (thin-competition) search demand confirmed; no dedicated page exists; distinct exam brand from Goethe/telc.
/german-a1-exercises/ , /a2-exercises/ , /b1-exercises/	Not justified as new pages	/practice-tests already exists and, per this project's history, is gated behind an identity/signup step with no separate URL per level. The right fix is to give /practice-tests real per-level indexable sub-routes (e.g. /practice-tests/a1) — not build a second, parallel "exercises" URL set that competes with it for the same intent.
/german-grammar/ , /german-vocabulary/	Partially justified — not yet	/resources already covers both topics, but thinly (one vocab list, one cases cheat sheet). Per the Keyword Opportunities section, these specific queries have zero Pakistan-specific competition — they're a long-term, hard-to-win global fight, better used as supporting depth for now. Expand /resources first; split into dedicated pages only once there's genuinely enough distinct content to justify two separate URLs instead of one thin one becoming two thin ones.

Recommended architecture (net change from today)

Keep the existing pattern — it's already mostly right — and add exactly three things:

`/telc-exam-preparation`, `/testdaf-preparation`, and per-level routes under `/practice-tests/`. Do not add a competing "learn-german-online-pakistan" page, do not rebuild the course-level pages under new URLs, and do not split `/resources` prematurely.

9. Internal Linking

Already working well (verified in code — don't touch): each course level page links to `/goethe-exam-preparation`, `/practice-tests`, `/blog`, and to every *other* level page via a "Continue Your Journey" section (`src/components/CourseLevelPage.jsx`). This is a genuinely solid pattern.

What to add:

- **Blog → money pages:** blog posts should link specific phrases to specific pages — e.g. the words "our German A1 course" linking to `/courses/german-a1`, "Goethe exam preparation" linking to `/goethe-exam-preparation` — inline in the post body, not only as a sidebar "related posts" widget.
- **New telc/TestDaF pages ↔ existing pages:** once built, cross-link them with `/goethe-exam-preparation` (as sibling exam-prep options) and with each course level page's "Exam Preparation" section.
- **`/practice-tests` → course pages:** add a line like "Ready for structured lessons? See our German A1 course" linking to the matching level page — turns a free-tool visitor into a course-page visitor.
- **Course pages → `/gallery` and `/testimonials`:** link near the pricing/CTA area ("See what our A1 graduates say") — this both strengthens those two otherwise-thin pages with contextual internal links and reinforces trust right before the ask.

Likely-orphan pages: `/founder` and `/books` currently seem to be reachable mainly through the footer's "Quick Links" block rather than from contextually relevant content (INFERRED from the page inventory — no page-body links to them were observed in the crawl). Fix: link to `/founder` from `/about` ("Meet our founder..."), and link to `/books` from `/resources` ("For structured self-study, see our recommended books").

Anchor text throughout should stay descriptive and specific ("German A1 course," "Goethe exam preparation") rather than generic ("click here," "learn more") — this is free, compounding SEO value the site isn't currently capturing anywhere it was checked.

10. UX/UI Audit

"Can a Pakistani student understand within 5–10 seconds what this offers, who it's for, how much it costs, and what to do next?" Mostly yes, with one real risk. The homepage's static/server-rendered content is genuinely clear and fast: hero copy, trust badges ("12,500+ Pakistani Graduates," "98.4% Exam Pass Rate," "4.9/5 Google Reviews"), and pricing in the footer all load immediately (VERIFIED). The problem is that the actual **course card grid** — the specific A1–B2 list with live pricing, exactly the thing a new visitor needs to answer "how much does this cost" — shows "Loading live batches..." until a client-side Supabase call resolves. On a fast connection this is invisible; on the slower mobile connections common outside Pakistan's biggest cities, a first-time visitor's critical first seconds could land exactly on that gap (INFERRED risk from the architecture, not measured directly — see Core Web Vitals section for what's genuinely unverified here).

Other UX findings:

- The WhatsApp CTA (`handleWhatsAppEnroll` , pre-filled message via `wa.me` links) is well-suited to the Pakistani market — **keep this, don't change it.**
- Pricing figures don't fully reconcile between the footer's bundle framing and the per-level prices on individual course pages — a visitor comparing two pages could get confused about what they'd actually pay.
- `/contact` mentions a "Berlin Campus Location," which reads as confusing for a business positioned as 100% online and Pakistan-focused — UNKNOWN if this is intentional (a real German partner office?) or leftover content; worth clarifying either way.
- The founder photo being a generic stock image (see Executive Summary) is a trust risk for any visitor who notices — and design-savvy visitors often do.
- `/teachers` — exactly the page a skeptical visitor checks to evaluate instructor credibility — currently shows nothing until JS resolves. This is the single worst place on the site for that failure mode to exist, since it's a trust-building page by definition.
- No single side-by-side comparison of all four levels (duration, price, prerequisites) exists in one place — a visitor has to visit four separate pages to compare. A simple comparison table would reduce decision friction.
- **Mobile rendering itself was NOT VERIFIED in this audit** — this audit could not screenshot or emulate an actual mobile viewport. Recommend the user personally check the site on a real phone or via Chrome DevTools' mobile emulation, particularly the course-card loading behavior on a throttled "Slow 3G" profile.

11. Conversion Audit

```

flowchart LR
  A[Google search] --> B[Landing page]
  B --> C[Trust signals]
  C --> D[Course understanding]
  D --> E[CTA]
  E --> F[WhatsApp / Demo]
  F --> G[Lead]
  G --> H[Enrollment]

```

Where the funnel actually leaks (INFERRED from site architecture — no analytics access, so this is reasoned, not measured):

1. **Google search → landing page:** this is the biggest leak by far — the site appeared in zero of the 16 realistic queries tested (Keyword Opportunities section). This isn't a conversion problem, it's a visibility problem addressed elsewhere in this report.
2. **Landing page → trust:** trust signals exist on the homepage itself (badges, teaser testimonials), but the two pages built specifically to deepen trust — `/teachers` and `/testimonials` — are respectively empty-on-load and thin-on-content. A visitor who clicks through specifically to verify credibility currently hits a weak page at exactly the moment they're deciding whether to trust the business.
3. **Course understanding → CTA:** low risk — the course-level pages are genuinely strong, with their own clear CTA.
4. **CTA → WhatsApp/Demo:** the WhatsApp flow itself works cleanly. However, no distinctly-labeled, prominent "free demo class" CTA was found on the homepage hero — the demo-class offer is mentioned on `/howItWorks` ("Experience a Live Online Demo Class First") but isn't surfaced as its own low-friction option up front, where a hesitant visitor would see it before the bigger "enroll" ask.

Recommendations (none involve fake scarcity or manipulative tactics):

- Keep WhatsApp as the primary CTA — it fits the market.
- Add a clearly-labeled "Book a Free Demo Class" secondary CTA in the homepage hero, not just inside `/howItWorks` — a free trial is a lower-friction first ask than "enroll now."
- Reconcile the bundle-vs-individual pricing discrepancy into one consistent presentation, ideally a simple Level / Duration / Price comparison table.
- Fix `/teachers` to show real instructor bios and credentials on first load (ties directly to Technical SEO fix A).
- Add real, specific testimonial quotes to `/testimonials` rather than only a rating badge.

- Confirm (this audit could not verify) that contact-form and enrollment-form submissions are reliably reaching the business — UNKNOWN either way, worth a manual test submission.

12. Local SEO

Per the brief's own instruction, this section does NOT recommend mass city pages.

But the current state is the opposite extreme: **zero** city-specific content exists anywhere on the site (VERIFIED via code search and live crawl), while every real competitor reviewed — Land of German Language, German House, IGL, Times Consultant, NCC — has dedicated Karachi/Lahore/Islamabad content or pages.

Recommended middle path: since the business is 100% online with (as far as this audit found) no physical branches to promote city by city, don't fake local presence with thin duplicate pages. Instead, add one genuine section — on the homepage or `/courses` — that directly addresses "German classes in Karachi / Lahore / Islamabad" by explaining that live online delivery works identically from any city, turning the online format into a differentiator against competitors who imply you need to visit a branch. If a real city-specific batch or timing ever exists (e.g., an evening batch timed for one city's audience), that's legitimately worth its own line — but don't invent one that doesn't exist.

Google Business Profile: flagged earlier in this project as "not publicly visible" with a failed verification attempt — UNKNOWN current status, not re-verified in this audit. This remains a real gap: a genuine, verified GBP listing with real reviews would help local-pack visibility and — importantly — could legitimately back the site's AggregateRating claim instead of the current hardcoded, unverifiable number (see Structured Data section).

LocalBusiness schema: correctly **not** used anywhere (only `Organization` schema was found in code) — and that's the right call, not a gap. `LocalBusiness` schema implies a physical location customers visit; adding it for a purely online school would be a legitimate structured-data misuse. **Do not add it** unless a real, visitable office exists.

NAP consistency and local citations/directories: NOT VERIFIED in this audit (would require checking directory listings directly). One legitimate, already-proven-relevant directory surfaced in competitor research: **Laimoon**, a real Pakistani course-aggregator site that ranks for "German course fees Pakistan" and even has city-specific variant pages — a listing there is a reasonable, non-spammy local citation opportunity (expanded in the Backlink Analysis section).

13. Core Web Vitals / Performance

NOT VERIFIED: this audit had no access to PageSpeed Insights, Lighthouse, or any real-user or lab performance measurement tool. No LCP, INP, CLS, or TTFB numbers below are measured — all are code-level risk factors only, clearly INFERRED, not invented scores.

Factor	Status	Why it's a risk (INFERRED)
Image optimization	No <code>next/image</code> used anywhere (0 files); 20 files use raw <code></code>	No automatic responsive <code>srcset</code> , resizing, or WebP conversion — likely inflates image payload and hurts LCP, especially for hero/course imagery
Client-side data fetching	4 key surfaces (<code>/courses</code> , <code>/teachers</code> , <code>/gallery</code> , homepage course list) fetch via <code>useEffect</code> + Supabase after JS loads	Content-visible time is gated behind an extra network round-trip on top of JS execution — likely hurts LCP/INP specifically for those sections
Lazy-loading	No explicit <code>loading="lazy"</code> attributes confirmed on the <code></code> tags reviewed	UNKNOWN whether this is handled another way; worth a manual check
Framework/stack	Next.js 16.2, React 18.3	A reasonably modern, capable stack — not itself a performance risk
Third-party scripts	UNKNOWN	Not assessed in this audit — would need a live network-request trace

Recommended next step: run the homepage and `/courses/german-a1` through Google PageSpeed Insights (free, no login, at pagespeed.web.dev) to get real, current LCP/INP/CLS numbers rather than relying on this audit's code-level inference. This audit deliberately did not invent scores here.

14. Structured Data

Full inventory, read directly from source code (VERIFIED — more reliable here than the live crawl, which had known trouble surfacing `<script>` tag contents on this site).

Schema	Where	Status
Organization + aggregateRating	app/layout.jsx , sitewide (every page)	Compliance risk — see below
WebSite	app/layout.jsx , sitewide	Fine, minimal (name + url only, no SearchAction)
Course	CourseLevelPage.jsx , each of the 4 level pages	Correctly implemented — only added when a real course row exists, includes name , description , provider ; matches Google's actual documented requirements. No fix needed.
FAQPage	/faq and independently inside each course level page	Correctly formed Question / acceptedAnswer structure in both places. No fix needed.
BreadcrumbList	Course level pages only	Missing on /blog/[slug] , /goethe-exam-preparation , and other deeper pages — a missed opportunity, not an error
Article / BlogPosting	Nowhere	Missing — blog posts have no article schema at all
Review (individual)	Nowhere	Correctly absent — do not add fake/synthetic reviews here. If genuine reviews are collected later (e.g. via a real Google Business Profile), real Review schema could be added truthfully then
LocalBusiness	Nowhere	Correctly absent — see Local SEO section, this is the right call for a purely online school

The one real problem: the sitewide AggregateRating

The Organization schema in the root layout carries a hardcoded aggregateRating of 4.9 / 348 reviews, applied to **every page on the site**, with **no individual Review markup anywhere backing it**. This exact 4.9/348 figure also appears as a hardcoded fallback

default inside `GoogleReviewsWidget.jsx`, used whenever its own live review API isn't configured or fails — meaning the number is not confirmed to be dynamically, verifiably sourced.

Why it matters: Google's structured-data guidelines treat a self-serving aggregate rating with no underlying, crawlable reviews as a known spam pattern — independent of whether the number itself happens to be accurate. This can mean the rich result is simply not granted, or worse, contribute to a manual action if it reads as misleading at scale.

Exact fix: either remove `aggregateRating` from the sitewide `Organization` schema entirely (the safe option), or replace it with a figure genuinely and dynamically pulled from a real, verified Google Business Profile (ties directly to the Local SEO section's GBP recommendation) — never a static fallback number presented as structured data.

Still open from this project's history

An earlier SEMrush check flagged "4 structured data items are invalid" on Course schema; a prior hypothesis (a price-formatting bug) was investigated and disproven with live pricing data. The Course schema implementation itself reads as correct in source code. **Recommend running a course page through Google's Rich Results Test directly** — that will show the exact validation error text, which this audit's tools cannot reproduce.

15. E-E-A-T / Trust

Instructor credibility — currently unaudit. `/teachers` is fully client-rendered with no bios, names, or credentials in the initial HTML (see Technical SEO fix A). This means it's not just a crawler problem — this audit genuinely could not assess whether real, verifiable instructor credentials exist behind that loading state. Fixing the rendering is a prerequisite to even being able to evaluate this properly, let alone have Google index it.

Founder identity. The `/founder` page names "Prof. Dr. Michael Weber" as founder and head mentor, illustrated with a generic Unsplash stock photo — **VERIFIED**, the image URL is the same stock-photo CDN pattern used for decorative imagery elsewhere on the site, not an uploaded original photograph. This is a genuine trust risk: a stock photo standing in for a named, credentialed individual undermines authenticity if a visitor notices (and design-conscious visitors often do). This audit cannot verify whether this is a real, identifiable person. Recommend either using a real photo of the real founder, or reconsidering the framing if there isn't one.

Student results claims. "12,500+ Pakistani Graduates," "98.4% Exam Pass Rate," and "4.9/5 Google Reviews (348+)" all appear prominently on the homepage — **VERIFIED** they're displayed. This audit could **not** verify their accuracy or underlying source — **UNKNOWN**. Recommend the business be ready to substantiate these if asked, and

ideally footnote them (e.g., "based on enrolled students since 2019") — both for genuine credibility and because an unverifiable superlative-style claim carries real reputational risk if challenged.

Contact information. Phone, email, and WhatsApp number are present and consistent across pages — **VERIFIED, good, no change needed.**

Missing trust pages. No Privacy Policy or Terms of Service exists (both confirmed 404), despite the site running both a contact form and an enrollment form that collect personal information. No refund/payment terms were found anywhere in this crawl — **UNKNOWN** whether they exist elsewhere. For a business asking people to pay for a multi-week course, this is a real, fixable trust gap, not just an SEO one.

Transparency. The "Berlin Campus Location" mentioned on `/contact` (flagged in the UX section too) raises a trust question here as well — worth clarifying publicly whether this is a real partner location or should be removed.

16. Content Gap Strategy

Group	Gap	Priority driver
Money pages	<code>/telc-exam-preparation</code> , <code>/testdaf-preparation</code>	Real demand + weak existing competition + direct product match + easy to link from the existing <code>/goethe-exam-preparation</code> page — highest priority
Supporting SEO pages	Per-level indexable routes under <code>/practice-tests/</code> (a1/a2/b1/b2)	Fixes an existing bug rather than requiring new content — very high value for the effort
Informational articles (blog)	Timeline content ("how long to reach B1 from zero"), visa-document content	Matches the visa/timeline search intent already identified in this project's history; do not re-cover the Goethe vs. telc vs. TestDaF comparison — that topic is already published
Practice resources	Deepen <code>/resources</code> before splitting it	Per the Information Architecture section — one solid page beats two thin ones

Group	Gap	Priority driver
Exam-prep resources	telc/TestDaF-specific mock questions and syllabus breakdowns	Extends the pattern that already works on <code>/goethe-exam-preparation</code>
German grammar / vocabulary	Fold into the <code>/resources</code> expansion for now	Zero Pakistan-specific competition exists for these terms — a long-term, low-priority global fight (see Keyword Opportunities)
Pakistan-specific content	Fee/pricing comparison content, city-delivery explainer	Matches the exact pattern already proven to rank for competitors (Laimoon, German House)

Priority order, by realistic impact-to-effort: telc/TestDaF pages first (new content, high leverage) → practice-tests URL fix (no new content needed, fixes a real bug) → blog timeline/visa content → `/resources` expansion → everything else.

17. Backlink Analysis

NOT VERIFIED: this audit had no access to a backlink tool (Ahrefs, Moz, or SEMrush's backlink module specifically) — domain authority, referring domain count, and link quality are all genuinely **UNKNOWN**, not estimated or invented here.

Realistic, legitimate opportunities surfaced by this audit's competitor research:

- **Laimoon** — a real, functioning Pakistani course-aggregator directory that already ranks for "German course fees Pakistan" and has city-variant pages. A genuine course listing there is a reasonable, non-spammy citation opportunity.
- **Pakistani university German-language departments** (NUML, LUMS's CES) — not a direct link ask, but these are legitimate, topically-adjacent institutions; worth exploring any resource-page or partnership mention opportunities on their sites, speculative and unconfirmed.
- **Genuine student-outcome PR** — real, verifiable stories (a visa approval, an exam pass) covered by local news or education blogs earn organic, newsworthy links without paying for anything.
- **Education directories** — `pakistaneducation.info` appeared repeatedly in this audit's search results as an apparently real, indexed directory; verify its legitimacy and relevance before listing.

Do not: buy links, use link farms or PBNs, or pursue any directory that exists purely to sell backlinks — none of that is recommended here, consistent with the brief's own instruction.

18. AI Search / SERP Visibility

Genuine existing strength: `llms.txt` already exists and is live (VERIFIED, confirmed working earlier in this project) — none of the 5 competitors reviewed showed any evidence of having this, making it a rare, forward-looking asset already in place. Don't touch it further beyond keeping it accurate and natural-language (no keyword stuffing — this project has already been deliberate about that).

Foundation that exists but is incomplete: FAQ content is present and schema-marked on `/faq` and each course level page (good raw material for Google's AI Overviews and "People Also Ask"), but the blog — the most natural home for step-by-step, comparison, and definitional content — currently has no `Article / BlogPosting` schema (see Structured Data section) and was showing as unindexed placeholder content at crawl time.

What would genuinely help, in priority order:

1. Add `Article / BlogPosting` schema to blog posts — helps establish authorship and entity clarity for both traditional and AI-driven results.
2. Keep using specific, factual numbers on course pages (exact hours, weeks, modules) — already done well (e.g., "100 hours, 10 weeks" on the B1 page) — this is exactly the kind of concrete fact these systems extract for direct answers.
3. Format new content (the telc/TestDaF pages, the timeline blog post recommended below) as clear comparisons, tables, and numbered steps rather than long unstructured paragraphs — e.g., "How to register for the Goethe exam in Pakistan" as a numbered sequence.
4. This project's history already shows good instincts here — a Goethe vs. telc vs. TestDaF comparison post already exists; that's exactly the comparison-table format that performs well in AI-generated answers. Don't duplicate it; extend the pattern to new topics instead.

19. Top 20 Problems

Consolidated from every section above, ranked. P0 = Critical, P1 = High, P2 = Medium, P3 = Low. Full evidence for each is in its section above; this table exists to prioritize, not repeat.

#	Problem	Priority	Fix (short)
1	<code>/courses</code> , <code>/teachers</code> , <code>/gallery</code> , and the homepage course list are pure client-rendered with no server data	P0	Convert to async Server Components (Technical SEO A)
2	4 pages canonical to the homepage instead of themselves	P0	Add correct <code>alternates.canonical</code> per page (Technical SEO B)
3	Sitewide hardcoded <code>AggregateRating</code> with no backing reviews	P0	Remove or replace with a real, dynamic source (Structured Data)
4	Site appeared in 0 of 16 realistic Pakistan search queries tested	P0	Downstream effect of #1, #2, plus new content below
5	No <code>next/image</code> anywhere; <code>next.config.mjs</code> images config blocks it from working	P1	Fix <code>images.remotePatterns</code> , roll out <code>next/image</code> (Technical SEO G)
6	Generic/duplicate OG+Twitter tags sitewide, zero <code>og:image</code> anywhere	P1	Page-specific OG metadata + a real share image (Technical SEO C)
7	<code>/teachers</code> shows no instructor content — an SEO and E-E-A-T failure at once	P1	Same fix as #1; flagged twice because it's also a trust page
8	No Privacy Policy or Terms pages despite two data-collecting forms	P1	Write and publish real pages (E-E-A-T)
9	Founder photo is generic stock imagery	P1	Real photo or clarify the identity (E-E-A-T)
10	No <code>/telc-exam-preparation</code> or <code>/testdaf-preparation</code> pages despite real (weak-competition) demand	P1	Build both (Information Architecture, Content Gap)
11	<code>/practice-tests</code> has no per-level indexable URLs (carried over from earlier in this project)	P1	Add per-level routes (Information Architecture)
12	No <code>lastmod</code> on any sitemap entry	P2	Extend existing blog logic to static routes (Technical SEO D)

#	Problem	Priority	Fix (short)
13	Pricing figures don't reconcile across pages (bundle vs. per-level)	P2	One consistent pricing table (Content Audit, Conversion Audit)
14	Translator tool hosted on a separate Vercel domain	P2	Confirm iframe vs. link; bring on-domain (Technical SEO I)
15	No <code>BreadcrumbList</code> schema beyond the 4 course-level pages	P2	Extend the existing pattern (Structured Data)
16	No <code>Article</code> / <code>BlogPosting</code> schema on blog posts	P2	Add per-post (Structured Data, AI Search)
17	Duplicate "German A1 Syllabus Explained" blog post (carried over, status unconfirmed)	P2	Manually delete the duplicate in the CMS
18	Zero city-specific content vs. every real competitor having some	P2	One honest section, not mass pages (Local SEO)
19	"Berlin Campus Location" on <code>/contact</code> is unclear for a Pakistan-only online school	P2	Clarify or remove
20	<code>WebSite</code> schema has no <code>SearchAction</code>	P3	Low priority; only relevant if internal search exists

20. 30-Day Action Plan

Week 1 — Stop the bleeding (P0s):

- Convert `/courses`, `/teachers`, `/gallery`, and the homepage's course-list section to server-rendered data fetching.
- Fix the 4 wrong canonical tags.
- Remove (or properly source) the sitewide `AggregateRating` schema.
- Confirm the already-pushed blog/sitemap revalidate fix is live and blog posts now appear in `sitemap.xml`.

Week 2 — Technical foundation (P1s, part 1):

- Fix `next.config.mjs` image config; begin `next/image` rollout on the homepage hero, course cards, and founder photo.
- Add page-specific Open Graph tags sitewide; create one real 1200×630 share image.
- Delete the duplicate "German A1 Syllabus Explained" blog post.

- Write and publish real Privacy Policy and Terms pages, linked from the footer.

Week 3 — New coverage (P1s, part 2):

- Build `/telc-exam-preparation` and `/testdaf-preparation`.
- Add per-level indexable routes to `/practice-tests`.
- Add the internal links identified in the Internal Linking section (blog → course pages, practice-tests → course pages, `/about` → `/founder`, `/resources` → `/books`).

Week 4 — Trust, verification, and re-audit:

- Reconcile pricing into one consistent presentation.
- Add real testimonial quotes to `/testimonials`; resolve the founder-photo question.
- Submit the updated sitemap in Search Console.
- Run Google's PageSpeed Insights and Rich Results Test on the homepage and a course page for real, current numbers this audit couldn't measure.
- Re-run the SEMrush audit to confirm the P0/P1 fixes actually landed.
- Check on Google Business Profile status.

21. 60-90 Day SEO Plan

- Expand `/resources` into genuinely deep German grammar and vocabulary content; only split into dedicated `/german-grammar` and `/german-vocabulary` pages once that depth justifies two URLs instead of one.
- Add `BreadcrumbList` schema to the remaining page types and `Article / BlogPosting` schema to all blog posts.
- Publish the visa-timeline and visa-document blog content identified in the Content Gap section — without re-covering the exam-comparison topic already published.
- Pursue the legitimate directory/citation opportunities identified in Backlink Analysis (Laimoon listing, verified education directories).
- Watch Search Console for indexing of the new telc/TestDaF/practice-tests pages specifically, and let the real query data that shows up there guide the next round of content — rather than guessing further ahead.
- Reassess whether the local-SEO section added to the homepage/`/courses` is doing anything measurable before considering any further local content.
- Put in place a real process for sourcing the "12,500+ graduates / 98.4% pass rate / 4.9 rating" claims so they can be footnoted and substantiated, not just displayed.

22. Exact Developer Tasks

1. **app/page.jsx**, **app/courses/page.jsx**, **app/teachers/page.jsx**, **app/gallery/page.jsx** — convert from 'use client' pages that fetch via `useEffect` to async Server Components that fetch from Supabase server-side and pass data down as props; keep only genuinely interactive bits as small client sub-components. Mirror the existing correct pattern in `src/components/CourseLevelPage.jsx` and the just-fixed `app/blog/page.jsx`.
2. **app/gallery/layout.jsx**, **app/enroll/layout.jsx**, **app/translator/layout.jsx**, **app/practice-tests/noun-builder/page.jsx** — add/fix alternates: { canonical: '/gallery' } (etc., matching each page's own path) in the metadata export.
3. **next.config.mjs** — change `images: { domains: [] }` to `images: { remotePatterns: [{ protocol: 'https', hostname: 'images.unsplash.com' }, /* + any Supabase storage hostname used for teacher/gallery images */ ] }`.
4. **Roll out next/image** across the 20 files currently using raw `<img>` (`src/components/Footer.jsx`, `Navbar.jsx`, `BookCard.jsx`, `GoogleReviewsWidget.jsx`, `VideoTestimonialsReels.jsx`, `ProtectedImage.jsx`, `src/views/Home.jsx`, `Founder.jsx`, `Teachers.jsx`, `Testimonials.jsx`, `Blog.jsx`, `BlogPost.jsx`, `BlogPostDetail.jsx`, plus the admin-only files which are lower priority since they're behind `/admin`) — start with above-the-fold images (hero, course cards, founder photo).
5. **app/layout.jsx** — remove the `aggregateRating` block from `orgSchema`, or replace it with a value sourced dynamically from a real, verified rating source rather than the current hardcoded `"ratingValue": "4.9", "reviewCount": "348"`.
6. **Every static page's metadata export** — add a page-specific `openGraph: { ... }` block (title/description/images), matching the pattern already correct in `app/blog/[slug]/page.jsx`'s `generateMetadata`. Create and host a real 1200×630 `og:image`.
7. **app/sitemap.js** — extend the existing `lastModified` logic (already correctly implemented for blog routes via `post.updated_at / created_at`) to the static routes array too.
8. **New routes:** `app/telc-exam-preparation/page.jsx`, `app/testdaf-preparation/page.jsx` — mirror the structure of `app/goethe-exam-preparation/page.jsx`.
9. **app/practice-tests/** — add per-level routes (e.g. `app/practice-tests/[level]/page.jsx`) with server-rendered, indexable content per CEFR level.

10. **app/blog/[slug]/page.jsx** , **app/goethe-exam-preparation/page.jsx** , the new **telc/TestDaF pages** — add `BreadcrumbList` schema using the existing `SchemaMarkup` component pattern already used in `CourseLevelPage.jsx` .
11. **app/blog/[slug]/page.jsx** — add `Article / BlogPosting` JSON-LD alongside the existing metadata.
12. **New pages:** `app/privacy-policy/page.jsx` , `app/terms/page.jsx` with real, specific content (not generic boilerplate) — link both from `src/components/Footer.jsx` .
13. **src/views/Translator.jsx / app/translator/page.jsx** — confirm whether `lese-lampe-translator.vercel.app` is embedded via `iframe` or linked out directly; if it's a plain outbound link, `iframe` it or move the tool onto the main domain.

23. Exact Content Tasks

- 1. URL:** `/telc-exam-preparation` **Primary keyword:** telc exam preparation Pakistan **Search intent:** informational + commercial (evaluating an exam-prep provider) **Suggested title:** telc Exam Preparation in Pakistan | German Learning School **H1:** telc Exam Preparation in Pakistan **Content sections:** What is the telc exam (and how it differs from Goethe) · telc exam modules · Preparation by level · telc B2 Medizin/Pflege track for healthcare professionals (this audience is already named in the site's own `llms.txt`) · Preparation strategy · Official telc information (link out to `telc.net`) · FAQ **Internal links:** from `/goethe-exam-preparation` (as a sibling option), from each course level page's "Exam Preparation" section, from the homepage's exam-prep teaser **CTA:** WhatsApp enroll / free demo class
- 2. URL:** `/testdaf-preparation` **Primary keyword:** TestDaF preparation Pakistan **Search intent:** informational + commercial **Suggested title:** TestDaF Preparation in Pakistan | German Learning School **H1:** TestDaF Preparation in Pakistan **Content sections:** What is TestDaF and why university applicants need it · TestDaF exam modules (TDN levels) · Preparation strategy · Who needs TestDaF specifically (ties to this project's university-applications audience) · Official TestDaF information · FAQ **Internal links:** same pattern as the telc page above **CTA:** WhatsApp enroll / free demo class
- 3. URL:** `/blog/how-long-to-learn-german-b1-timeline` (slug placeholder) **Primary keyword:** how long to learn German B1 / German learning timeline Pakistan **Search intent:** informational, early-funnel **Suggested title:** How Long Does It Take to Reach German B1 From Zero? A Realistic Timeline for Pakistani Students **H1:** same as title **Content sections:** Why B1 specifically matters (visa/work context) · a realistic hours-per-level breakdown (reuse the already-verified "80 hours"/"100 hours" figures from the course pages — don't invent new numbers) · factors that speed up or slow down progress · a suggested weekly study routine · what comes after B1 **Internal links:** to each course level page as timeline milestones, to the Goethe/telc/TestDaF prep pages **CTA:** free demo class / WhatsApp

4. (repeat pattern for A1/A2/B1/B2) URL: `/practice-tests/a1` (and `/a2`, `/b1`, `/b2`)

Primary keyword: German A1 practice test / German A1 exercises Pakistan **Search**

intent: tool/practice, supports both engagement and lead-gen **Suggested title:** Free

German A1 Practice Test | German Learning School **H1:** German A1 Practice Test **Content**

sections: level description · test modules (grammar, vocabulary, reading, listening) · start-

test interaction · a link to the matching course page for structured lessons **Internal links:**

from `/practice-tests` (the hub), from `/courses/german-a1` **CTA:** "Ready for structured lessons? See our German A1 course"

24. Final Priority List

The 20 actions worth actually doing, in order. Everything else in this report is context for *why* — this is the *what, in what order*.

1. Convert `/courses`, `/teachers`, `/gallery`, and the homepage course list to server-rendered data fetching
2. Fix the 4 wrong canonical tags (`/gallery`, `/enroll`, `/translator`, `/practice-tests/noun-builder`)
3. Remove or properly source the sitewide hardcoded `AggregateRating` schema
4. Confirm the already-pushed blog/sitemap revalidate fix is live
5. Fix `next.config.mjs` image config and begin the `next/image` rollout
6. Add page-specific Open Graph tags sitewide and create a real `og:image`
7. Delete the duplicate "German A1 Syllabus Explained" blog post
8. Write and publish real Privacy Policy and Terms pages
9. Build `/telc-exam-preparation`
10. Build `/testdaf-preparation`
11. Give `/practice-tests` real per-level indexable URLs
12. Confirm `/teachers` shows real instructor bios and credentials once fix #1 lands
13. Replace the founder's stock photo with a real one, or clarify the identity
14. Add the internal links identified in section 9 (blog → courses, practice-tests → courses, about → founder, resources → books)
15. Reconcile pricing into one consistent presentation
16. Add `lastmod` to every sitemap entry, not just blog posts
17. Add `Article` / `BlogPosting` schema to blog posts
18. Add `BreadcrumbList` schema beyond the course-level pages
19. Confirm and fix the `/translator` off-domain hosting situation

20. Set up/verify Google Business Profile, then run PageSpeed Insights and Google's Rich Results Test for the real numbers this audit could not measure directly

Audit performed by direct code review of the live Next.js/Supabase codebase, live crawling of all 22 indexed URLs plus `robots.txt` / `sitemap.xml` / `llms.txt`, and live search testing of 16 Pakistan-relevant queries against real competitor sites — September 2026. Every claim above is marked VERIFIED (directly observed), INFERRED (strong conclusion from evidence), or UNKNOWN/NOT VERIFIED (would require a tool this audit didn't have access to). No search volume, ranking position, backlink metric, or performance score was invented anywhere in this report.
